

Arbor-Tect Columns & Anchoring System

Arbor-Tect architectural columns are load bearing, manufactured using fiberglass-reinforced polymer composite materials. They are completely resistant to weather and insects, and are extremely durable in both residential and commercial applications.

Classic round columns are available in a 12" x 8' size, rated to 18,000 lbs. of compressive load. Decorative bases and capitals fit over the column shaft and do not affect the overall height of the column. The caps and bases are made of the same material as the column shaft. All components are easy to finish using a high quality exterior paint.

Contemporary square columns are available in 8", 9" and 10" widths. Standard heights are 8', 9', 10' and 12', and custom height columns are available on request. Square columns are rated to 10,000 lbs. compressive load. Decorative caps, bases and beads are manufactured from high density urethane materials for durability and resistance to the elements.

A kit is also available to allow the columns to be anchored to wooden or composite deck surfaces. Ask your Arbor-Tect representative for details.
